

ABSTRACT

[00040] Impact cushions are mounted to the upright arms of the mast at the horizontal lifting arms of a fork lift truck. The cushions are molded monolithic bodies, each having a flat mounting surface for engagement with the upright arm of the mast, a semi-cylindrical load engaging surface opposed to the flat mounting surface for engaging pallets and/or loads carried by the fork, and parallel flanges straddling the flat mounting surface for aligning the mounting surface to the mast.
